Connection

Function

In order to retain the interference immunity, functional grounding of the cable shields is required.

This type of grounding is no protective grounding. It is used only to discharge cable faults, and does not have to meet any safety guidelines (e.g. personal protection) whatsoever.

For shield grounding, the plug-in stud has to be screwed to one of the bus connectors used. Use the nut also enclosed for attachment. By no means open the primary attachment nut of the plug-in connector. The connecting assembly may be damaged and the housing may become leaky. The plug-in stud should be contacted to a low-impedance connection of the surrounding metal parts (such as mounting socket, frame).
