

## Level probe LGC2

- Device for hydrostatic pressure measurement in liquids
- High resistance to overload
- High-precision, robust ceramic measuring cell with long-term stability
- Simultaneous level and temperature measuring by optional integrated Pt100 resistance thermometer
- Measuring ranges: 0 bar ... 0.1 bar to 0 bar ... 20 bar
- Electronics comprising 4 mA ... 20 mA output signal and integrated overvoltage protection
- KTW and NSF drinking water approval

### Function

The level probe is a hydrostatic pressure sensor for measuring the level. One outstanding feature of these device is its mechanical and electrical durability. The embedded electronics, a heavy-duty conical cable seal and a 2-filter system guarantee a perfect seal resistant to any climatic conditions.

Highly accurate ceramic measuring cell with long-term stability guarantee reliable and secure filling level measurement.

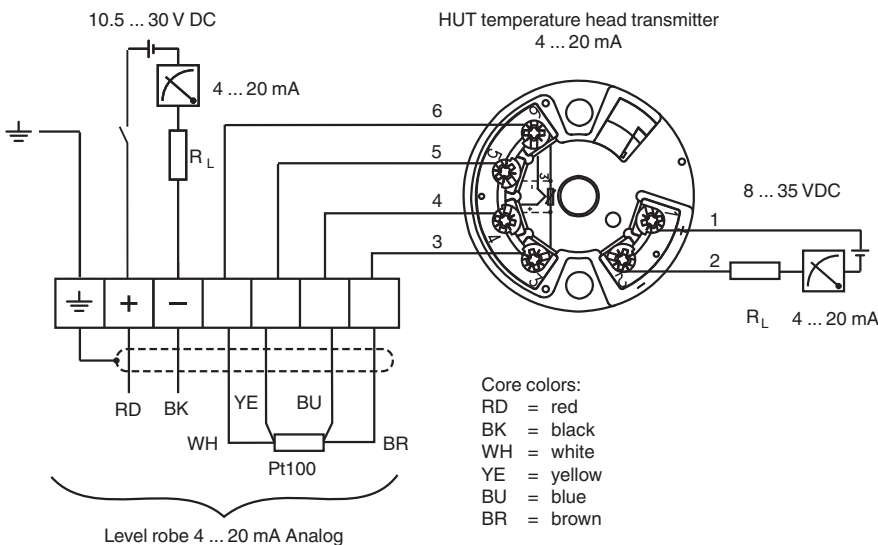

The device is offered in three variants:

- Device with a stainless steel housing, external diameter of 22 mm (0.87 inch): This version is excellently suited to drinking water applications and for use in bore holes and wells with small diameters
- Device with a stainless steel housing, external diameter of 42 mm (1.65 inch): Heavy-duty version and easy to clean thanks to flush-mounted process isolating diaphragm, ideally suited to wastewater and wastewater treatment plants
- Device with plastic insulation, external diameter of 29 mm (1.14 inch): Robust version for use in salt water and excellently suited to applications on ships (e. g. ballast water tanks)

With extensive measurement accessories, like display, power supply and evaluation device, solutions for all typical applications in fresh water and wastewater are guaranteed.

### Connection

Example: level probe with Pt100 and HUT temperature head transmitter (4 ... 20 mA)

Measuring method	Level control with ceramic measuring cell (dry measuring cell). The pressure acts directly on the rugged ceramic membrane of the device and causes it to move by about max. 0.005 mm. The effects of air pressure on the liquid surface are transferred via a pressure compensating tube through the extension cable to the rear of the ceramic membrane and compensated. Pressure-dependent changes in capacitance caused by membrane movement are measured at the electrodes of the ceramic carrier. The electronics convert the movement into a pressure-proportional signal which is linear to the medium level.	
Equipment architecture	As standard, the complete measuring system consists of a level probe and a transmitter power supply unit with a supply voltage of 10.5 to 30 V DC.
